Voice efficiency: **150 WPM** vs typing's **40 WPM**.

Crucial for deep emotional engagement and integration into high-utility contexts like driving, cooking, and walking.

UX Analysis & Voice-First App Comparison

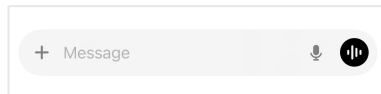

Positive UX Insights

- Supports multiple Indian Languages.
- Supports multilingual conversational switching naturally.
- Background conversation mode which works while using other apps or Screen OFF.
- Real-time interaction

Needs Work

- Low Discoverability. Placed at the bottom with no voice first Entry Point
- No hands free trigger/ wake up call.
- Limited use due to low cross app connectivity.
- No real Value proposition. Internet Connectivity is a Must

Key Voice First App Differences

- Wake Up call: Google, Siri all use a wake up call/ hands free trigger.
- Integrated Apps: Google can help with maps, phone calls etc. Alexa can help with music and home.
- Whatsapp voice feature has a clear value proposition and a playback feature. (7B+ notes daily)
- Prompts users to speak immediately. "Hey! How Can I help you?"
